Landfill Waste Classification and Waste Definitions

Uncontaminated Fill Packages (WA)

Background

The State Government of Western Australia has legislation that permits clean fill (and other fill material meeting certain thresholds) to be used on development and construction sites without attracting any waste avoidance and resource recovery fees. 'Clean fill' is defined in the Waste Definitions to mean raw and excavated natural material such as clay, gravel, sand, soil, or rock files that:

- has been excavated or removed from the earth in areas that have not been subject to potentially contaminating land uses including industrial, commercial, mining, or agricultural activities; and
- has not been processed except for the purposes of achieving desired particle size distribution; and/or removing naturally occurring organic materials such as roots; and
- does not contain any acid sulphate soil; and
- does not contain any other type of waste.

Introduction of Uncontaminated Fill Criteria

Table 6 of the WA Landfill Guidelines details Maximum Concentrations (thresholds) of relevant chemical substances and limits of relevant physical attributes for uncontaminated fill. For a sample to be considered uncontaminated the Department of Water and Environmental Regulation requires both the total concentration and leaching tests to assess the quality of the fill material.

Table 7 of the WA Landfill Guidelines, the minimum sampling and testing standards for uncontaminated fill, allows for testing of substances based on land use history and statistical evaluation of the laboratory results. This includes a reference to the list of potentially contaminating activities, industries, and land uses (Appendix B) of the Assessment and Management of Contaminated Sites document (DER 2014). Therefore, Appendix B is key to determining what tests are relevant from Table 6.

ALS has created several packages to assess the criteria laid out in Table 6 of the guidelines. The P-19/4 packages meet the requirements stipulated by the Maximum Concentrations and the P-19/5 packages meet the requirements of the Leaching tests. See Tables 1 and 2 below for a list of package inclusions. If you require a variation, please contact Client Services to receive a project specific quotation.

WA Waste Classification Packages

Potentially contaminated soil in Western Australia destined for disposal via landfill must be classified as Class I, II, III, IV or V (WA DWER Landfill Waste Classification and Waste Definitions December 2019). To categorise the soil, total concentrations of specified analytes are compared against the upper limits of the Contaminant Thresholds (CT -Table 3) and Concentration Limits (CL - Table 4) where CT values are absent. To cater to these analytical requirements ALS has the following packages displayed in Table 2 which can be utilised.

Table 3. Contaminant threshold (CT) values for waste not requiring a leach test.

CONTAMINANT	P-19/1	P-19/2	P-19/3	CT1 (mg/Kg)	ALS LOR (mg/Kg)
Metals

Automated Comparison Reporting

The ALS generated Guideline Report presents the laboratory results against selected guideline limits. The report assists by removing the need for manual comparison of a large number of data points. Additionally, a summary of all breaches is presented at the beginning of the report (see Figure 2 example). The aim of this report is to assist ALS clients with accurate and rapid assessment, facilitating on-site management options or further classification analysis as required (e.g., ASLP determination). To receive this report, simply request the report format 'GL_Generic Test' on the chain of custody accompanying the samples.

Figure 1. Summary of guidelines reached or exceeded

Compound	Method	LOR	Unit							
EG005(ED093)T: Total Metals by ICP-AES										
Aluminium	EG005T	50	mg/kg	----	50000	15400	3790	2950	15500	8480
